

Task 1

ETL Process in Power BI

The ETL process (Extract, Transform, Load) is used to build relationships and visualize insights from the data. The following steps outline the process:

- Extract
 - Upload the CSV file into Power BI Desktop as demonstrated in the CW video.
- Transform (in Power Query):
 - Clean the data by removing any errors in the sales table columns.
 - Ensure columns have the correct data types by converting them to the appropriate format.
 - Enhance the Date table by adding columns for month name, month number, and year.
- Load (into Power BI):
 - Once data transformation is complete, load the data into Power BI by clicking on 'Close & Load'.

Task 2

- Calculate the relevant measures and columns. (ticked in the screenshot below).

Task 3

- Add a new tab and name it **“Monthly Sales/Profit%”** and create a dashboard that matches the screenshot given below:

Icons given

Task 4

- Add a new tab and name it **“Sales by Product Hierarchy”** and create a dashboard that should match with the screenshot given below:

Task 5

- Add a new tab named **“Region”** and create a dashboard that should match with the screenshot given below:
